

Trauma-Informed Oregon Surveys

Evaluation and accountability are key components of implementing trauma-informed care. They are useful for assessing what organizational areas could be prioritized as well as a general understanding of an organization as a whole as relevant to TIC. The following list are different survey tools TIO regularly offers organizations interested in TIC. Feel free to reach out to info@traumainformedoregon.org if you would like a copy or guidance for how to use these surveys.

TIO Standards

This assessment measures to what degree respondents feel their organization is aligned with the [Standards of Practice](#). It organizes all standards per domain and asks respondents to state to evaluate if their organization has not started addressing the standard, is in progress addressing the standard, or is maintaining the standard via a likert scale. After each domain, it requests respondents to prioritize which the top three standards that should be addressed first in implementation. This survey has 54 survey items.

TIO Short TIC Evaluation

This survey is a short questionnaire intended for a post-training evaluation. The goal of this survey is to provide TIO with feedback to help improve trainings and explore respondents' training experience. It assesses any perceived knowledge shifts, commitment to TIC, emotional well-being during the training, accessibility, and training areas for improvement. It contains a mix of open-ended questions and likert scale questions. This survey has 19 survey items.

TIO Online Modules

This survey was developed to gather feedback about TIO's free online training course. Though it is specific to this particular training, it could be used as a template to evaluate other trainings. It contains the following survey items: general contact information, demographics/identities, commitment to TIC, what respondents would like to learn more about, and any specific feedback to the online training modules. It contains a mix of open-ended questions and likert scale questions. This is a short survey.

TIO Demographics

This survey is used for TIO's in-house TIC Champions data. It contains demographic survey items that align with Oregon Health Authority's R.E.A.L.D./S.O.G.I. standards. These include gender identity, sexual orientation, ethnic/racial identities, language fluency, disability, and service sector. The survey also includes service sector and county respondents primarily work in. The majority of the survey items are multiple-choice or checkbox questions. This survey is made up of 11 questions.

TIC Self-Assessment

This assessment helps gauge survey respondents' general background in TIC knowledge and trainings. TIO primarily uses this survey gather a baseline of interested organizations to inform what future trainings would be most appropriate. It contains likert scale survey items related to foundational trainings such as what trauma-informed care is, the science behind trauma, workforce wellness, and implementation of TIC. This survey contains 14 questions and can be customized to include additional training topics.

TIC Screening Tool

The screening tool is a questionnaire version of the [TIC Road Map to TIC](#) by delving into each phase and survey items representing a series of developmental actions within each phase step. These steps include recognition and awareness, foundational knowledge, agency readiness, process & infrastructure, information gathering, planning, and implementation & monitoring. Survey items are likert scale items. It ends by asking respondents which phase they feel their organization is in. This survey contains 36 survey items.

Foundational Knowledge and Other Predictors of Commitment to Trauma-Informed Care

Dr. Stephanie Sundborg developed this detailed assessment which investigates multiple variables that can influence commitment to TIC. It can be used for pre-post testing for trainings. It measures the following characteristics: foundational knowledge, perceived principal support, TIC self-efficacy, beliefs about trauma and its impact, organizational strain, and intergenerational transmission of trauma. Most survey items are measured via a likert scale. There are two open-ended survey items specific to commitment to TIC. This survey contains 71 survey items excluding demographics questions (+4).

*For more information about this assessment, see [Sundborg, Stephanie A](#) for more information.

TIC Knowledge and Perceived Self-Efficacy

This assessment measures actual TIC knowledge rather than perception of knowledge. It contains a series of true/false questions, multiple choice questions, and check-box questions which measure TIC knowledge. It ends with a likert scale series of survey items measuring perceived TIC self-efficacy. This assessment contains 51 questions.
